

Original Report:

Patient Name : MR. SARVESH BHUJALE Referral : Dr Yasmin A K Chataiwala -

MBBS

Age / Gender : 21 Years / Male

Receiving Time : Jul 18, 2024, 11:23 a.m.

Patient Id : 14583

Reporting Time : Jul 18, 2024, 01:46 p.m.

Test Description Value(s) Reference Range Unit(s)

COMPLETE BLOOD COUNT

Haemoglobin (Hb) 14.9 13.0 - 17.0 gm %

Method : NON-CYANIDE HEMOGLOBIN ANALYSIS

METHOD

Erythrocyte(RBC) Count 5.18 4.5 - 5.5 millions /

Method : ELECTRICAL IMPEDANCE METHOD cu-mm

PCV(Packed Cell Volume) 42.3 40 - 50 %

Method : RBC PULSE HIGHT DETECTION METHOD

MCV(Mean Corpuscular Volume) 81.7 83.0 - 101.0 cu-microns

Method : CALCULATED

MCH(Mean Corpuscular Hb) 28.8 27.0 - 32.0 Pg

Method : CALCULATED

MCHC(Mean Corpuscular Hb Conc.) 35.2 31.5 - 34.5 %

Method : CALCULATED

RDW(Red Cell Distribution Width) 12.8 11.6 - 14.0 %

Method : CALCULATED

Total Leucocytes(WBC) Count 4800 4000 - 10000 per cu-mm

Method : ELECTRICAL IMPEDANCE METHOD

Neutrophils 66 40 - 80 %

Method : CALCULATED

Lymphocytes 20 20 - 40 %

Method : CALCULATED

Eosinophils 04 1 - 6 %

Method : CALCULATED

Monocytes 10 2 - 10 %

Method : CALCULATED

Basophils 00 0 - 2 %

Method : CALCULATED

DC 100 0 - 100

Absolute Neutrophils Count 3168 2000 - 7000 /c.mm

Method : CALCULATED

Absolute Lymphocytes count 960 1000 - 3000 /c.mm

Method : CALCULATED

Absolute Eosinophils Count 192 20 - 500 /c.mm

Method : CALCULATED

MBBS

Age / Gender : 21 Years / Male

Receiving Time : Jul 18, 2024, 11:23 a.m.

Patient Id : 14583

Reporting Time : Jul 18, 2024, 01:46 p.m.

Test Description Value(s) Reference Range Unit(s)

Absolute Monocytes count 480 200 - 1000 /c.mm

Method : CALCULATED

Absolute Basophils Count 0 0 - 100 /c.mm

Method : CALCULATED

Platelet Count 76 150 - 410 x 10³ /uL

Method : ELECTRICAL IMPEDANCE METHOD

MPV(Mean Platelet Volume) 12 6.8 - 10.9 fL

Method : CALCULATED

RBC on smear Normocytic Normochromic

WBC on smear Normal

Platelet on smear Reduced with macroplatelets

Interpretation

Sample Type: EDTA Whole Blood.

Instrument: Test done on Hematology Analyser Sysmex XP-100.

All abnormal Haemograms are reviewed and confirmed microscopically.

Test Description Value(s) Reference Range Unit(s)

Malarial Parasites (MP) - S

Malaria Parasite Rings of *P. Falciparum* seen.

Interpretation

Specimen: EDTA whole blood

Method: Microscopy-thin & thick smears

Interpretation :

1. Four species of plasmodium parasites are responsible for human malaria infections- *P. falciparum*, *P. vivax*, *P. ovale*, and *P. malariae*.

Malaria is a parasitic disease characterised by fever, chills and anaemia. It is caused by a parasite that is transmitted

from human to human by the bite of infected female *Anopheles* mosquitoes.

2. Parasites are usually seen during febrile episode

Single smear does not rule out malaria.

Repeat smears may be required if strong clinical suspicion.

3. Parasitaemia after adequate therapy is indication of resistant strains.

Peripheral smear examination is a screening test and other methods like Malaria Antigen test and PCR should be

used for confirmation especially in low parasite index.

AI Explanation:

Alright, let's break this down for you in simpler terms. Your medical report has checked the cells in your blood. This includes things like the cells that carry oxygen (red blood cells), the cells that fight off infection (white blood cells) and the cells that help your blood to clot (platelets).

Now if we look at your report, your levels are generally good. Your hemoglobin, or the part of your

red blood cells that carries oxygen, is within a healthy range, as are your red and white blood cell counts. This means that your body is efficiently transporting oxygen and is ready to fight off infections.

But there are two things of note:

1. Your platelets, the blood cells that prevent bleeding and help wounds heal, are below the normal range. This could lead to slower healing and increased bleeding. You also have bigger than normal platelets, which is what "macroplatelets" mean.

2. The report says "Malaria Parasite Rings of P. Falciparum seen." This means that you have been infected with the parasite that causes malaria. Malaria can make you feel very sick and give you high fever, chills, and anemia, which is a condition that means your body doesn't have enough red blood cells. It's transferred to humans by the bite of infected female Anopheles mosquitoes.

However, just one smear test does not confirm malaria. This is just a screening test able to detect the presence of malaria parasites. If there is a strong clinical suspicion, you may need to take more tests, like a Malaria Antigen test or PCR for final confirmation especially when the number of parasites are low.

That's a super simple breakdown of your report. As always, you should follow up with your doctor to discuss what it all means and decide the next steps.
